

- Working based Centering attachment model using CAD Software.
- Demonstrated the use of advanced assembly features and use of GD&T.

COMPOUND GEAR TRAIN - ASSEMBLY

What?

- Designed a Compound Gear Train.
- Mainly designed for 3D Printing the parts individually.

How?

- Used SolidWorks to design the gears
- Implemented the DFA principles and tolerances between parts for movements.
- Used involute equations in gear tooth design.

Results

- Designing for 3D printing demonstrated.
- Implementing DFMA principles for manufacturing and assembly.

MY OTHER SOLIDWORKS PROJECTS:

Ergonomic Hair Dryer – SURFACE MODELING.

Phone Cover Design

Free Form Surface Modeling.

Weldment Design

Sheetmetal Design

SOLIDWORKS FLOW SIMULATIONS:

What?

- S1233 Airfoil - FSAE Rear Wing Flow Simulation.
- Ran a Flow Simulation study in SolidWorks on an S1233 airfoil to understand the airflow around the rear-wing section designed for an FSAE car.
- Used pressure contours and flow trajectories to look at how the pressure changes over the airfoil as it moves around it, with the main goal of understanding how the wing can generate downforce for improved traction and cornering on track.

ONSHAPE & SOLIDWORKS:

SolidWorks Software: UAV

Some designs I worked on at UBCO Aerospace club V-Tail config

SolidWorks Rendering

Onshape Software: UAV

Part of UBCO Aerospace Club - Front Canard's design
